, and string 5 was used to calculate the root mean square error (RMSE) for each approach. A simple linear regression was used to evaluate the relationship between the scoring strings and the rating scale. A linear regression was used for each raters to compare the different parameters. Results ======= There was a strong positive relationship between the scoring strings and the rating scale (r = 0.962, 0.967, 0.960, and 0.972, respectively). The RMSE analysis showed that the 3-parameter scoring system was more accurate than the 2-parameter scoring system. The 3-parameter scoring system offered a better fit than the 2-parameter scoring system. For a given sample, the estimated change from the true value was smaller with the 3-parameter scoring system, and the 95% confidence intervals were also smaller (Table [1](#T1){ref-type="table"}). The ROC analysis also showed a larger area under the curve (AUC) and better precision with the 3-parameter scoring system compared with the

2-parameter scoring system. 82157476af
